
Social Bookmarking Module & Plugin to increase your webste traffic

Posted by johnnydement - 2008/02/27 06:35

This thread discusses the Content article: Social Bookmarking Module & Plugin to increase your webste traffic

for module, it supports 1.5 under legacy. If you need native 1.5 for mod and plugin, just copy part of the source code (logic) and use YouCMSAndBlog Module & Plugin Wizard to generate it.

Never heard about that, can you elaborate a bit about?

thanks!

lurking google...

found it! will give it a try... although I'm not a coder xD

So, I can't avoid thinking... if it's so easy, how is you haven't done yourself? doubt it would be easier for me that I don't know the code than for you :blink:

:laugh: just consider i m trying very hard to promote this plugin and need more ppl to help me test it out. And on the same time, try to encourage more ppl to become Joomla developer ;)

okay..i m quite busy right now developing new component...but as i have helped to generate just now same mod in joomla 1.5 native version. Click here to download

btw, if have time..try it.....see how easily you can create your own Joomla module. For plugin, I havent got chance to write up a proper tutorial about Joomla plugin development.

Hello! Just installed the plugin on Joomla 1.5 and it works fine on the homepage. However, going into the different articles, it seems that the URLs being submitted don't use the current URL that my page is on. Its still stuck on the main page. You can see this in action at my site.

Even when looking at different articles, the social bookmarking links still point to the homepage. Try this link.

Is there something I'm doing wrong? Can you please help me? Any help would be very much appreciated.

Cheers!
Raymond

Hi Everybody,

:) Is there a manual for this Social Bookmarking Module for Joomla 1.5 ?

I need to know how to set it up.

Thanks for the useful and great module. Especially how do you remove the notice under the bookmark "module is designed by etc"

;) Hanly

hi raymond,

it was very weird. i even tried to view generated HTML and seems like your the link has been escaped by "/" char and thus, still pointing to your website URL. Any special plugin you have installed on your site ? anyone here can help raymond ?

Re:Social Bookmarking Module & Plugin to increase

Found a way to fix it. Its really stupid of me to have failed to realize this earlier. After your comment on plugins, I tried turning off the legacy plugin and the bookmarks now work perfectly on the homepage.

However, when I'm on an article page, it seems that it doesn't work for me again. When mousing over the bookmark icons, the correct address shows up in the browser's statusbar but after clicking it, the new windows opened has the "http://corpusjuris.santosestrella.com/" address is appended before the proper link. Thus, bringing me to a 404 page.

I've triple-checked my plugins and I don't think there's anything there modifying the site's behavior anymore. Should I edit the source code itself?

hi raymond, yes you may try to customise it from its PHP though myself still dont really understand why another "/" char shown in generated HTML and very specific occurred to your website only. (or any one experienced & have solved ?)

alternatively, you may want to try out this service by copy and paste its HTML code to your php file. (you can use YouCMSAndBlog Joomla Module Generator to generate new module for Joomla 1.5 on the fly).

If 2nd approach also give u the same problem, really run out of idea for u :(
