
mod_babelfish

Posted by qneal78710 - 2008/01/26 07:52

when I login to my site and then click on the spanish translation or any other translation, I end up going back to my login screen. When I try to login, it never takes. I can't leave the login screen. Although the translation of the login screen is in the language I selected, I can't move around to other parts within my website.

Yeah, you can login in the original language but when you then change the language you get logged out. Is that what you mean?

if that s what qneal78710 is referring to ...definitely guys, cause this mod make use of Altavista.com Babelfish translation which wont keep your session during redirection but still very helpfull if your site provides lots of content, i.e. blogging etc that not required logging in.
still planning to develop another translator mod which can be used after logged in but definitely wont be using the same service.

Admin,

You should warn everybody about this, because we all think that we'll be able to use it on our websites throughout.

this is a big mistake and will turn people off if they start thinking the way I'm thinking this mod work. Google already has a language translator for people want to see another language on the fly. I wanted a language translator for those logged in.

hi qneal78710,

thank you for the feedback. As I have mentioned, I m planning and going to work on for the integration (support login) but this will require additional component to support the module itself and no commitment from me when it should be ready since it is provided free for everyone to download and use. Will notify everyone through newsletter once it is ready.
