
VivoCiti Google AJAX Translator

Posted by marcel - 2008/04/03 18:05

Hello,nice plugin, however when I press translate nothing happens, not om my site as well on vivocity. I tried it with IE7 and FireXox.

See homepage below at my www.bedrijfsmeditaties.nl

Kind regards,
Marcel

hi marcel,

indeed it is true when i tried to click on vivociti.com itself tonight and some other websites which provide example of Google Ajax Translation.

For this moment, I have no idea why it happened but definitely there is something goes at Google's site. have no problem since first time i launched this plugin till now.

will post here for whatever news about this issue.

if any other members know some news about this, pls help to share it here as well.

thanks !

hi everyone, latest information I got from the web:
As March 2008, Google only allows only maximum 500 characters to be translated.
I have updated the example and now it is working again.

Hopefully Google will increase total of chars for translation in a future.

anyone is welcome to update this post in a future.

thanks.

To me exactly the same thing happens do you need to introduce some APIs KEY google somewhere in the HTML page so that it can function properly? I have tried to translate a sentence and not anything else, at least we need a little more information about this module and how to set it up.

Thanks :)

hi,

you only need to install this joomla plugin to 1.0 and 1.5, enable it and start to using it. As long as less than 500 chars supported by Google, should be translated.

what i m thinking for next version of this plugin is to prompt a message or printed out if chars exceeded 500 chars.

or make it a bit more intelligent, i.e. split sentences to 500 chars for each request to Google Ajax service for the translation.

i need some time to try out this idea.
