## Dont Work

Posted by ronildo - 2007/10/04 21:43

---

Hi friend, I'm testing this great tools.  
I have a problem I dont get view in HTML.

When I click in "Launch Internet Explorer", it send for this url "http://localhost/joomlabase" but I dont have anyone joomlabase template or site.

Do you have any explain??

Thanks for help us with this greatest tool.  
I promise divulge it.

\*Sorry my English, I'm learning :laugh:

hi Ronildo,

I think it would be nice if you can read through this short tutorial in order for you to have a little bit understanding of the concept of this small tool. :)

But to simplify it for you, your problem I believe is because you were opening Joomla template and detected by YouCMSAndBlog however it could not find http://localhost/joomlabase address (TrueView mode). You may change this in configuration.xml on the same folder as YouCMSAndBlog exe file.

Hope it helps.

Sunwu

Some questions, cause the preview doesn't work for me.  
Besides, I read the tutorial but I guess I don't understand everything. :blush:

1. I run a local server (xampp)
2. Joomla is installed at localhost/joomla
3. I installed YouCMSAndBlog WYSIWYG IDE3 into c:\programs\cms
4. I changed the configuration.xml (http://localhost/joomla)
5. When I open a joomla template (localhost/joomla/template/test/index.php) I don't see a trueview preview (it shows 'OFF' in the left corner).
6. When I open one of your sample templates e.g. at BlogTemplateSamples the QuickView works.

---

7. I really need help! :blink:

Thanks in advance :)  
Frank

hi Frank, oh no... :)  
btw, which template you re opening ? 1.0.x or 1.5 ?

If it were 1.5 and since I havent put in as part of the default installation (It mean you will need to download the template from Download section, submitted by one of VivoCiti's member last time) . Also, dont forget to update (register) it inside configuration.xml

---

Hi,

it was a 1.5 template, which I tried to open.

I don't understand the meaning of "download the template from Download section". Which template? I thought templates are just layouts.

How can I register joomla 1.5 in the configuration.xml? By keywords? If yes, what keywords?

Sorry, but I'm a totaly joomla newbie.:laugh:

Once again thanks for your patience and help. And quite sure I will give something back.

Frank

---

EDIT

I found the taglist for Joomla 1.5 in the download section, I guess this is what you were talking about? I've downloaded and renamed it to joomla.taglist.xml. As a result the taglist for joomla changed in 'YouCMSAndBlog WYSIWYG IDE'. Great! But still no preview.

hi Frank,

you re almost there, pls hang on...:)  
you re right to download the taglist template from Download section.

The "template" term here is not referring to Joomla template, but it is referring to YouCMSAndBlog taglist "template" definition.

You can get more full understanding about their terminology by by reading this tutorial about how can you create a new YouCMSAndBlog taglist template. In other words, you can create new taglist template for not only Joomla, but others

---

open source & commercial CMS.

Okay, now back to your problem:

1. Dont modify downloaded joomla15.taglist.xml to joomla.taglist.xml since joomla.taglist.xml (shipped together with YouCMSAndBLog zip file) is for Joomla 1.0.x and has been configured inside configuration.xml. As for now, pls restore back the original one

2. Open joomla15.taglist.xml (the one you have downloaded from Download section) with any text editor.

3. Read line #3 about how you can install this taglist template by modifying configuration.xml (which is by copying entire block of starting from Line #5)

This taglist template was a great work with good comment inside created by Luc Wuyts ...sigh he dont leave any trace or email address so cant credit back to him :)

Hope you have clearer picture now.

\*Muharhar

It works! Got it! Thank you very much! :woohoo:  
keep up your good work!

Very easy to use, great! Now I'm cool again B)

Frank
